TRANSMISSÃO

Tensionamento

O melhor tensionamento é aquele ponto em que a transmissão está com o tensionamento sem a correia patinar. Uma transmissão pouco tensionada provoca desgaste e superaquecimento pelo atrito. Quando supertensionada, poderá comprometer os eixos, mancais e rolamentos pela fadiga prematura. Na impossibilidade de uso de uma ferramenta de aplicação prática, use seu bom senso (use seus olhos e ouvidos para detectar se a correia patina quando em funcionamento, aplicando-se uma força no vão da transmissão para verificar se está frouxa ou se está tensa demais).

SOLTE OS ESTICADORES NÃO FORCE

A substituição de correias sempre deve ser feita sem o uso de ferramentas que entrem em contato com a correia ou com a polia. Assim procedendo, você preservará a vida dos cordonéis e manterá as polias intactas.
